Matlab

Things are great. The wife has a job at the law school here, the kid is in daycare on campus, and I am working away. Exactly what I had hoped.

Attached is my complete folder for the stern macro class. To create the matlab min-manual:

- You just edit a normal matlab .m file and add some special comments. They can separate out sections, add latex, etc.
- You then choose the "Publish" button when the file is open (or publish button on the publish toolbar, depending on what version you have). You can choose what output type you want, but I think I had the most success with setting the output file format to pdf
- If you do this on the file matlab_intro.m in the /lectures folder of the attached zip file, you will see good examples of what is possible.
- The matlab help pages are: http://www.mathworks.com/help/matlab/matlab_prog/publishing-matlab-code.html and more advanced stuff in http://www.mathworks.com/help/matlab/matlab_prog/marking-up-matlab-comments-for-publishing.html

As for Vancouver jealousy: that can be fixed easily by moving here! Did I see that you may be out here for a seminar one of these days?
